

Business Problem Statement

DataCo Global, a worldwide distribution company operating across multiple markets and product categories, is facing rising logistics costs alongside a growing number of customer complaints about late deliveries. Leadership has noticed that shipments are frequently arriving later than promised, but the company currently lacks a consolidated view of its delivery performance. Without this visibility, the business cannot determine where delays originate, which parts of the operation are underperforming, or how these delays are affecting overall profitability.

Delivery performance is influenced by many factors — shipping mode, service tier, region and market, product category, and the gap between scheduled and actual shipping times. Leadership needs to understand which of these factors most strongly drive late deliveries, and whether poor delivery reliability is concentrated in specific areas or is a systemic, company-wide problem.

The main task is to analyze the company's order and shipping data to address the central business question:

“How can the company use its supply chain and delivery data to identify the root causes of late deliveries, improve on-time performance, and protect profitability?”

Deliverables

1. **Data Cleaning & Preparation (Excel / Power Query):** Profile and clean the raw dataset — correcting inconsistent date formats, removing redundant and PII columns, and validating completeness so the data is ready for analysis.
2. **Data Enrichment (VLOOKUP):** Map each order's shipping mode to a business-friendly service tier (Priority, Standard, Economy) to support clearer segmentation.
3. **Exploratory Analysis (Pivot Tables):** Use pivot analysis to surface early insights around late-delivery rates by shipping mode and region, and profitability by mode.
4. **Dashboard & Visualization (Power BI):** Design an interactive dashboard with KPIs and visuals that surface delivery-performance trends and patterns to support stakeholder decision-making.
5. **Written Report:** Summarize the methodology, findings, and business recommendations in a clear analytical report.
6. **GitHub Repository:** Compile the cleaned data workflow, dashboard assets, and documentation into a clean, well-organized repository.
